

We Claim:

1 1. A method of performing embossed-style bump mapping comprising:
2 providing a vertex attribute descriptor that describes Tangent and Binormal
3 vector data for each of plural vertices of a polygon;
4 computing a light direction vector;
5 computing texture coordinate displacements for each of said vertices in
6 response to said light direction vector and said Tangent and Binormal vector data;
7 generating texture coordinate values in response to said computed texture
8 coordinate displacements; and

9 texture mapping said polygon based on said texture coordinate values to
10 provide an embossing effect;

11 wherein the texture coordinate displacements computing step does not use
12 Normal vector data to compute said texture coordinate displacements.

1 2. A method as in claim 1 where said per-vertex data includes at least a
2 Normal, a Tangent, and a Binormal vector.

1 3. A method as in claim 1 further including transforming the Tangent and
2 Binormal vectors to eye-space.

1 4. A method as in claim 1 wherein the texture coordinate displacement
2 computing step includes performing vector dot-product computations between the
3 computed light direction vector and the Tangent and Binormal vectors.

1 5. A method as in claim 1 wherein the light direction vector computing step
2 comprises computing at least a normalized light-to-vertex vector.

1 6. A method of performing embossed-style bump mapping comprising:

decoding a generalized texture coordinate generation function that specifies generating embossed-style bump-mapping texture displacements;

perturbing input texture coordinates based on binormals and light direction information in response to the decoding step;

using the input texture coordinates and the perturbed texture coordinates to look up texels in a height-field bump map;

computing bump height information based on the texel values; and

combining the bump height information with pixel color value information to provide embossed-style bump mapping;

wherein the combining step is performed in texture processing hardware.

7. The method of claim 6 wherein the perturbing step is performed in hardware.

8. The method of claim 6 wherein the perturbing step comprises computing texture coordinate displacement values based a Tangent vector and a Binormal vector and a dot-product of each vector with a light direction vector.

9. The method of claim 6 wherein the computing step comprises subtracting texel data acquired using perturbed texture coordinates from texel data acquired using input texture coordinates.

10. The method of claim 6 wherein the decoding step comprises decoding a generalized vertex attribute description function that specifies a Tangent vector and a Binormal vector.

11. The method of claim 10 wherein the Tangent and Binormal vectors are specified by reference to separate memory indexes.

12. In a graphics system including a processor and a separate graphics processing pipeline having transformation and lighting circuitry, the pipeline performing emboss-style bump-mapping based on texels in response to texture coordinate displacements computed from Tangents and Binormals, an improvement comprising:

texture coordinate displacement computation circuitry included within the graphics pipeline vertex transformation and lighting circuitry.

13. In a graphics system including a processor and a separate graphics processing pipeline, the pipeline performing emboss-style bump-mapping based on texels in response to textures coordinate displacements computed from Tangents and Binormals, an improvement comprising performing the texture coordinate displacement computation within the pipeline.

14. A graphics processing system having vertex transformation and lighting processing hardware and an enhanced API vertex attribute description command function for specifying at least Tangent and Binormal object-space surface vectors, wherein the geometry processing and lighting hardware transforms the object-space Tangent and Binormal vectors to eye-space, computes an eye-space light direction vector based a light position and a vertex position, and performs vector dot-product computations between the computed light direction vector and the transformed Tangent and Binormal surface vectors to generate texture coordinate displacements for use in creating an embossed texture effect, and wherein the Tangent and Binormal vectors are scaled by scaling a model view matrix and applying the scaled model view matrix to the Tangent and Binormal vectors.

15. In a graphics processing system that renders and displays images at least in part in response to polygon vertex attribute data and texture color data stored in

an associated memory, a vertex transformation and lighting processing portion embodied in hardware, comprising:

a vector processing unit comprising at least two distinct dot-product computation circuits for computing vector dot-products; and

a bump-mapping unit for computing at least a normalized light-to-vertex vector and a set of texture displacement values for use in creating an embossed texture effect.

16. In a graphics processing system that renders and displays images at least in part in response to polygon vertex attribute data and texture color data stored in an associated memory, vertex transformation and lighting processing hardware comprising:

vector processing circuitry comprising a plurality of dot-product computation units; and

bump-mapping circuitry comprising an inverse square-root computation circuit for computing a reciprocal of a square-root of an input value and at least one floating point multiplier and one floating point adder.

17. The geometry vertex and lighting processing hardware of claim 16 wherein the bump-mapping unit further comprises a FIFO input buffer for storing incoming texture coordinate values.

18. The vertex transformation and lighting processing hardware of claim 16 wherein the bump-mapping unit further comprises a floating point adder for computing a light-to-vertex vector.

19. The vertex transformation and lighting processing hardware of claim 16 wherein the dot-product computation units comprise at least one floating point multiplier and one floating point adder.

1 20. In a graphics processing system that renders and displays images at least
2 in part in response to polygon vertex attribute data and texture color data stored in
3 an associated memory, the graphics system including vertex transformation and
4 lighting processing hardware for generating texture coordinate displacement values
5 for implementing at least embossed-style bump-mapped texture effects, the vertex
6 transformation and lighting processing hardware comprising:

7 a first vector dot-product computation unit for transforming vector data to
8 eye-space;

9 a second vector dot-product computation unit for computing lighting
10 direction vector dot-products;

11 an inverse square-root computation unit for computing a reciprocal of a
12 square-root of an input value;

13 at least one floating point multiplier unit; and

14 at least one floating point adder unit;

15 wherein in response to an API bump mapping function instruction the
16 vertex transformation and lighting processing hardware transforms vector data per-
17 vertex into eye-space, computes texture coordinate displacement values based on
18 lighting direction vector dot-products, and adds the displacement values to texture
19 coordinates for use in producing emboss-style bump-mapped texture effects.

1 21. The graphics processing system of claim 20 further including a graphics
2 API vertex attribute function which specifies at least Normal, Tangent and
3 Binormal vectors per vertex, or specifies an index to at least each of these vectors
4 stored in memory.

1 22. The graphics processing system of claim 20 wherein the API bump
2 mapping function is defined to specify one of at least eight different textures for
3 producing embossing effects.

1 23. The graphics processing system of claim 20 wherein the Normal,
2 Tangent and Binormal vectors each comprise three 32-bit vector elements.

1 24. In a graphics processing system that renders and displays images at least
2 in part in response to polygon vertex attribute data and texture color data stored in
3 an associated memory, the graphics system including a geometry transform unit
4 comprising hardware for at least computing a coordinate-space transformation and
5 a vector dot-product, a method of implementing embossed-style bump-mapped
6 texture effects in graphics rendering system, comprising the steps of:

7 storing a texture data image in memory, the texture data image comprising
8 color values parameterized by at least two coordinate values representing two
9 orthogonal axes for mapping the image:

10 supplying light position information, texture coordinate information, vertex
11 position information and object-space Normal, Binormal and Tangent vector data
12 per polygon vertex to the geometry transform unit, wherein for each vertex said
13 Binormal and Tangent vector data map respectively, in an object-space coordinate
14 system, to each orthogonal axis of the bump-map image;

15 transforming the object-space Normal, Binormal and Tangent vector data to
16 an eye-space coordinate system;

17 computing a light direction vector from light position and vertex position
18 information;

19 computing a texture coordinate displacement based on a vector dot-product
20 between the light direction vector and each of the Binormal and Tangent eye-space
21 vector components;

22 adding the texture coordinate displacement to eye-space texture coordinates
23 to obtain a set of displaced texture coordinates;

24 using the set of displaced texture coordinates to retrieve texture color data
25 from the stored texture data image; and

26 performing texture subtraction in one pass.

1 25. A method of performing embossed-style bump mapping comprising:

2 providing a description of Tangent and Binormal vectors for each of plural
3 vertices of a polygon;

4 providing a light direction vector;

5 computing texture coordinate displacements for each of said vertices in
6 response to said light director vector and said Tangent and Binormal vector;

7 generating texture coordinates in response to said computed texture
8 coordinated displacements; and

9 texture mapping said polygon based on said texture coordinates, including
10 providing a texture combining operation that performs texture subtraction in a
11 single pass.

1 26. The method of claim 25 wherein said texture combining is performed in
2 texture hardware.

1 27. The method of claim 25 further including scaling the Tangent and
2 Binormal vector data by scaling a model view matrix and applying the scaled
3 model view matrix to the vector data.

1 28. The method of claim 25 wherein the texture coordinate displacement
2 computing does not use a Normal vector.

1 29. The method of claim 25 wherein the texture coordinate displacement
2 computing computes the following in parallel:

3 a first vector dot-product between the light direction vector and the Tangent
4 vector,

5 a second vector dot-product between the light direction vector and the
6 Binormal vector, and

7 the square of the light direction vector.

1 30. The method as in claim 25 wherein the texture coordinate displacement
2 computing step is performed using two distinct dot-product computation units, the
3 first dot-product computation unit computing eye-space transformation of the
4 Tangent and Binormal vectors, the second dot-product computation unit computing
5 at least vector dot-products between the light direction vector and each of the
6 Tangent and Binormal vectors.

1 31. In a graphics chip including a logic array, a pipelined arrangement
2 implemented within the logic array that performs embossed-style bump mapping
3 based on Tangent and Binormal vectors for each of plural vertices of a polygon
4 and a light direction vector, said arrangement including:

5 a dot-product computation unit and associated logic circuitry adapted to
6 receive a scaling factor, the dot-product computation unit and associated logic
7 circuitry scaling a model view matrix in response to the scaling factor and applying
8 the scaled model view matrix to the Tangent and Binormal vectors to provide
9 texture coordinate displacements for each of said vertices; and
